

I am against BPL in its current forum. With it being high in interference with radio signals HAM radio should not be interfered with for the sake of a new broadband option in already broadband heavy cities. Maybe engineers can modify it to work with little to no interference if not then get broadband other ways. Such as Fixed Wireless, Satellite Internet, dsl, cable modem, isdn, or the new 3g-cell phone towers. It seems there is enough competition out there already and most areas can get broadband and the areas that can't are usually rural. There is no guarantee that BPL will do rural areas why should they it wouldn't be profitable.
